3 Dynamic Algorithms

4 Results

## Modularity-Driven Clustering of Dynamic Graphs

In this work we

- pioneer **online dynamic modularity maximization**
- develop dynamizations of
  - the currently best heuristic algorithms
  - an optimal algorithm
- evaluate them on
  - dynamic clustered random graphs
  - dynamic real-world networks
- give sound recommendations for the choice of an algorithm

## Modularity-Driven Clustering of Dynamic Graphs

In this work we

- pioneer **online dynamic modularity maximization**
- develop dynamizations of
  - the currently best heuristic algorithms
  - an optimal algorithm
- evaluate them on
  - dynamic clustered random graphs
  - dynamic real-world networks
- give sound recommendations for the choice of an algorithm

# Clustering: Intuition and Formalization

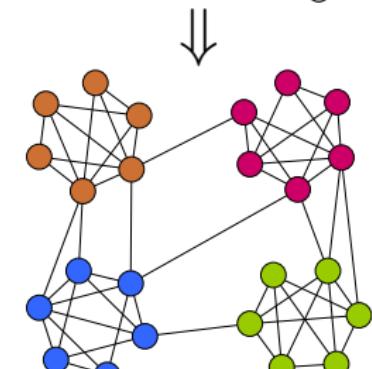

Task

partition a graph into natural groups

Paradigm

intra-cluster density vs.  
inter-cluster sparsity

Formalization

a variety of clustering quality indices

# Quality: Coverage & Modularity

- **Coverage:** fraction of intra-cluster edges
  - $cov(G, \mathcal{C}) \in [0, 1]$

## Definition (**Coverage**)

$$cov(G, \mathcal{C}) := \sum_{C \in \mathcal{C}} \frac{|E(C)|}{|E|}$$

- **Modularity:** Coverage minus expected coverage
  - $mod(G, \mathcal{C}) \in [-1, 1]$  [GIRVAN, NEWMAN 2004]

## Definition (**Modularity**)

$$mod(G, \mathcal{C}) := cov(G, \mathcal{C}(G)) - \mathbb{E}[cov(G, \mathcal{C}(G))]$$

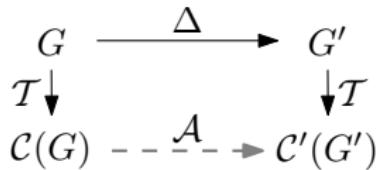

## Dynamic Instances

changing networks with evolving group structure

## Dynamic Approach

update previous clustering reacting to changes in the graph

Clustering update problem

### Criteria

- speed
- quality
- smooth transitions

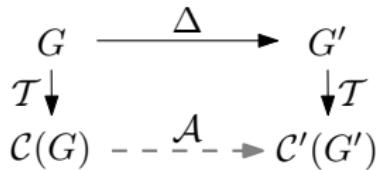

## Dynamic Instances

changing networks with evolving group structure

## Dynamic Approach

update previous clustering reacting to changes in the graph

Clustering update problem

### Criteria

- speed
- quality
- smooth transitions

## Theorem

MODOPT is  $\mathcal{NP}$ -hard [BRANDES et al. 2008]

## Corollary

DYNMODOPT is  $\mathcal{NP}$ -hard

1 Basics

2 Static Algorithms

3 Dynamic Algorithms

4 Results

[NEWMAN et al. 2004]

- **globally greedy**
- cluster agglomeration

---

## Algorithm 1: Global

---

```
1 repeat
2   | compute all  $\Delta_{mod}(C_i, C_j)$ 
3   | merge best cluster pair
4 until max.  $\Delta_{mod} \leq 0$ 
```

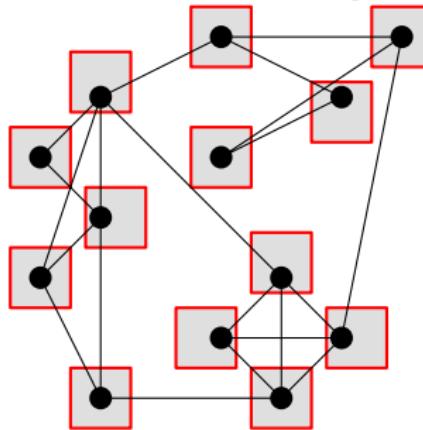

---

[NEWMAN et al. 2004]

- **globally greedy**
- cluster agglomeration

---

## Algorithm 1: Global

---

- 1 **repeat**
  - 2   | compute all  $\Delta_{mod}(C_i, C_j)$
  - 3   | merge best cluster pair
  - 4 **until**  $\max. \Delta_{mod} \leq 0$
- 

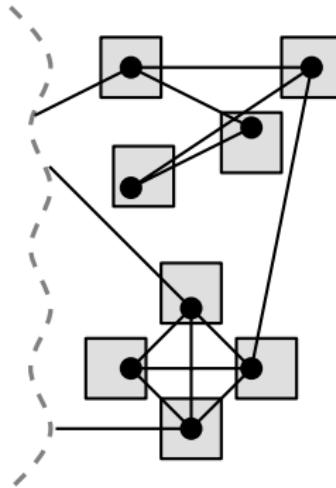

## Pseudo-Dynamic Algorithm

**sGlobal:** start **Global** from scratch after each change

# Heuristics: Local

[BLONDEL et al. 2008]

- locally greedy
- node shifts
- hierarchical contractions

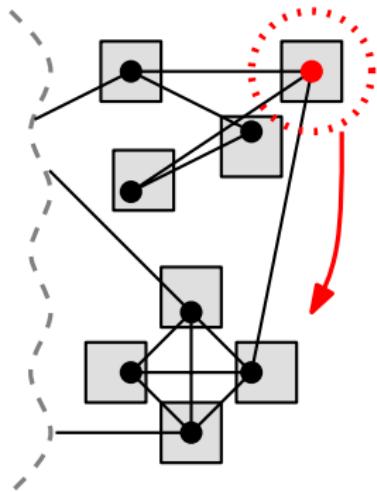

## Pseudo-Dynamic Algorithm

sLocal: start Local from scratch after each change

# Heuristics: Local

[BLONDEL et al. 2008]

- locally greedy
- node shifts
- hierarchical contractions

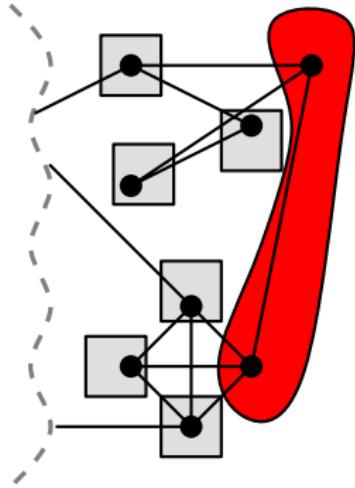

## Pseudo-Dynamic Algorithm

sLocal: start Local from scratch after each change

# Heuristics: Local

[BLONDEL et al. 2008]

- locally greedy
- node shifts
- hierarchical contractions

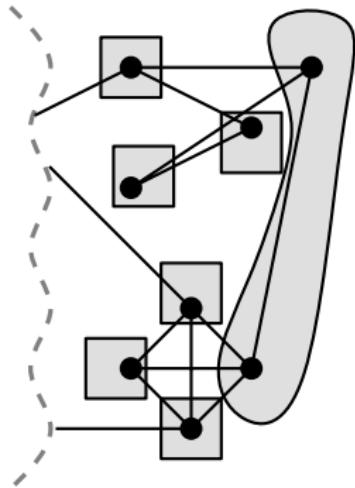

## Pseudo-Dynamic Algorithm

sLocal: start Local from scratch after each change

# Heuristics: Local

[BLONDEL et al. 2008]

- locally greedy
- node shifts
- hierarchical contractions

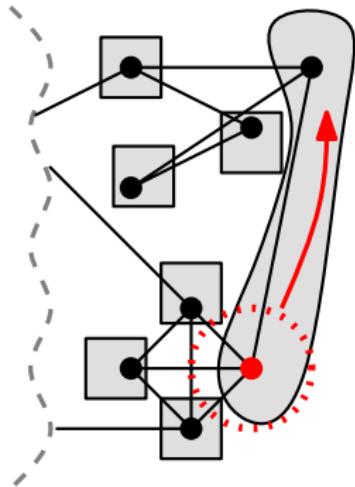

## Pseudo-Dynamic Algorithm

sLocal: start Local from scratch after each change

# Heuristics: Local

[BLONDEL et al. 2008]

- hierarchical contractions

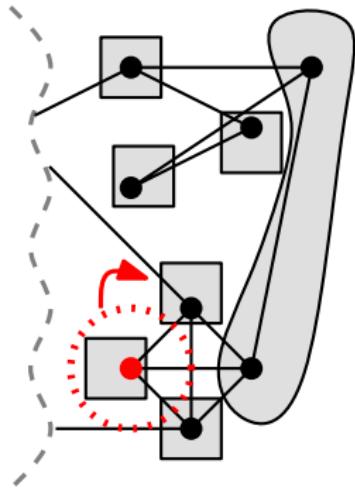

## Pseudo-Dynamic Algorithm

sLocal: start Local from scratch after each change

[BLONDEL et al. 2008]

- locally greedy
- node shifts
- hierarchical contractions

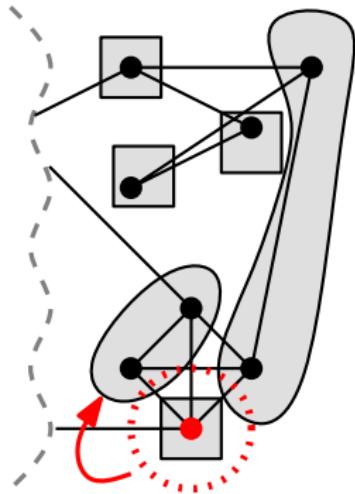

## Pseudo-Dynamic Algorithm

**sLocal:** start **Local** from scratch after each change

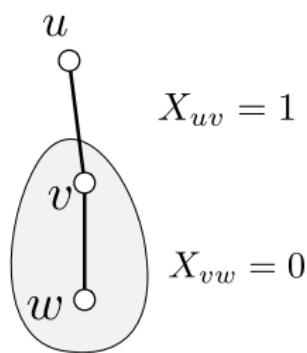

# Optimization: ILP approach

- 1 introduce decision variables

$$\forall \{u, v\} \in \binom{V}{2} : X_{uv} = \begin{cases} 0 & \text{if } \mathcal{C}(u) = \mathcal{C}(v) \\ 1 & \text{otherwise} \end{cases}$$

- 2 ensure valid clustering with constraints (transitivity):

$$\forall \{u, v, w\} \in \binom{V}{3} : \begin{cases} X_{uv} + X_{vw} - X_{uw} \geq 0 \\ X_{uv} + X_{uw} - X_{vw} \geq 0 \\ X_{uw} + X_{vw} - X_{uv} \geq 0 \end{cases}$$

# Optimization: ILP approach

- ③ optimize target function:

$$\text{mod}_{\text{ILP}}(G, \mathcal{C}_G) = \sum_{\{u,v\} \in \binom{V}{2}} \left( \omega(u, v) - \frac{\omega(u) \cdot \omega(v)}{2 \cdot \omega(E)} \right) \cdot X_{uv}$$

[BRANDES et. al 2008]

## Pseudo-Dynamic Algorithm

**sILP**: start ILP from scratch after each change. Infeasible!

# Optimization: ILP approach

- ③ optimize target function:

$$\text{mod}_{\text{ILP}}(G, \mathcal{C}_G) = \sum_{\{u,v\} \in \binom{V}{2}} \left( \omega(u, v) - \frac{\omega(u) \cdot \omega(v)}{2 \cdot \omega(E)} \right) \cdot X_{uv}$$

[BRANDES et. al 2008]

## Pseudo-Dynamic Algorithm

**sILP**: start **ILP** from scratch after each change. **Infeasible!**

# Prep Strategies: Concept

## prep strategy $S$

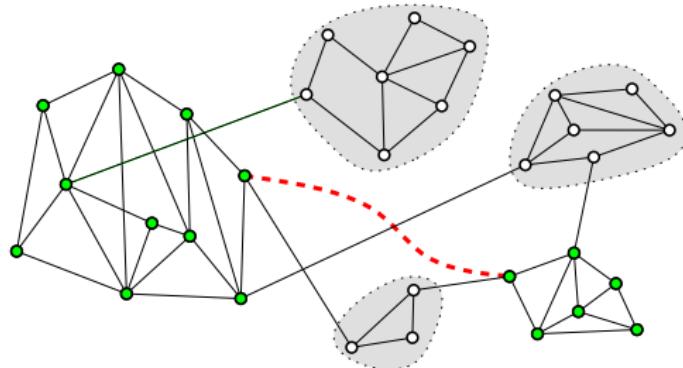

- reacts to changes
- prepares half-finished  
**preclustering**  $\tilde{\mathcal{C}}$
- passes  $\tilde{\mathcal{C}}$  on to algorithm

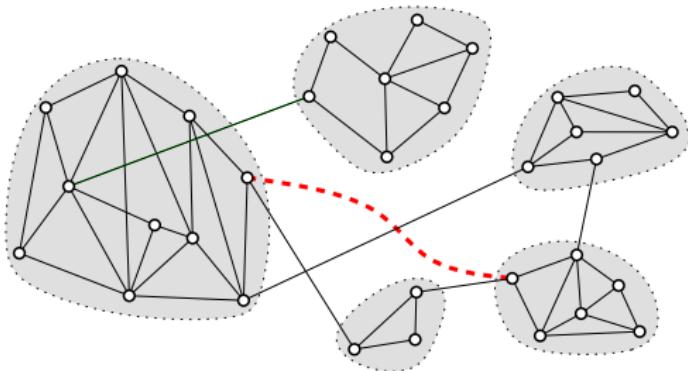

## Prep Strategy

BU: Break up the affected clusters entirely

## Prep Strategy

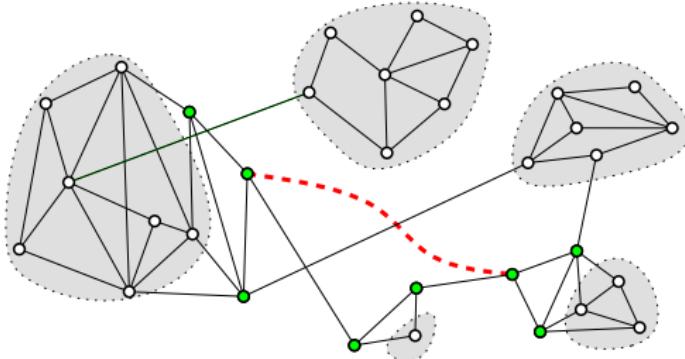

**BU:** Break up the affected clusters entirely

## Prep Strategy

**N:** free a **neighborhood** up to a depth  $d$  with **BFS**

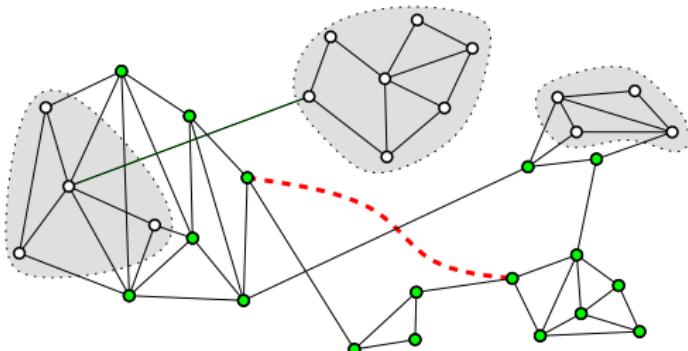

Experiments: What is the best choice for  $d / k$ ?

## Prep Strategy

**N:** free a **neighborhood** up to a depth  $d$  with **BFS**

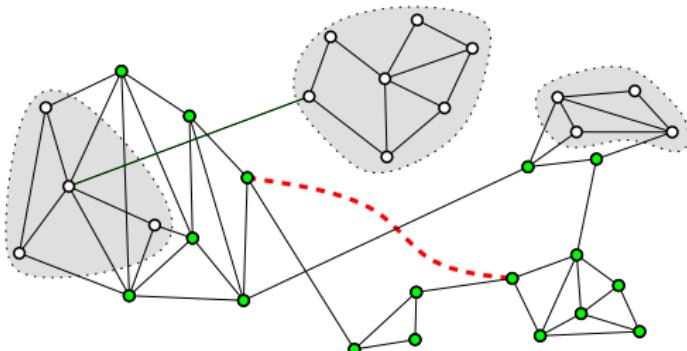

Experiments: What is the best choice for  $d / k$ ?

## Prep Strategy

**N:** free a **neighborhood** up to a depth  $d$  with **BFS**

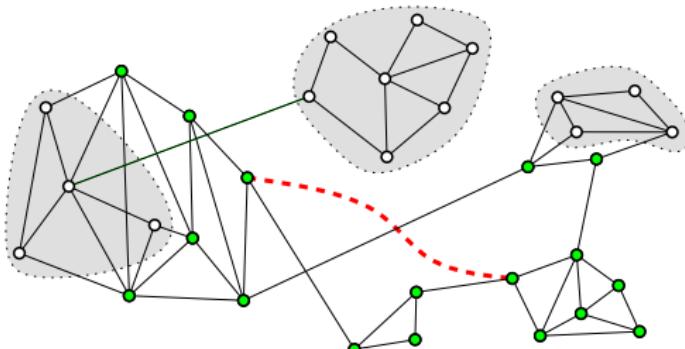

Experiments: What is the best choice for  $d / k$ ?

## Prep Strategy

**BN:** free a **bounded neighborhood** of up to  $k$  of nodes with **BFS**

Experiments: What is the best choice for  $d / k$ ?

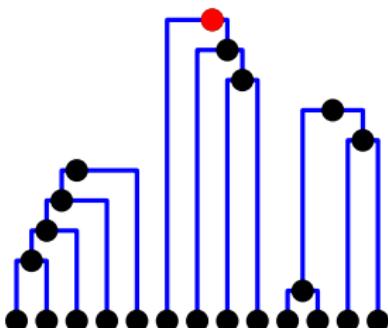

## Prep Strategy

**BN:** free a **bounded neighborhood** of up to  $k$  of nodes with **BFS**

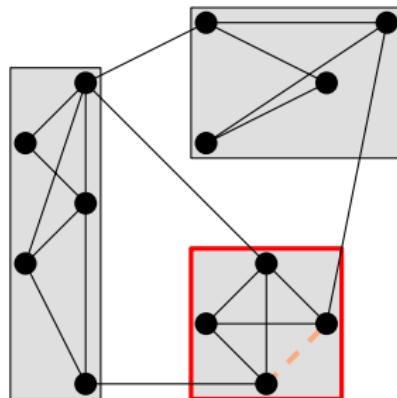

Experiments: What is the best choice for  $d / k$ ?

# Prep Strategy BT: Illustration

## Prep Strategy

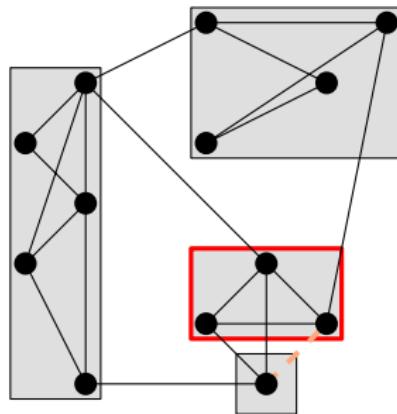

BT: Backtrack Global's mergers according to heuristic rules

# Prep Strategy BT: Illustration

dendrogram

current clustering

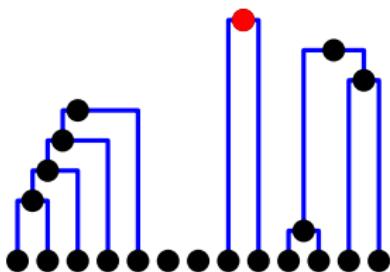

## Prep Strategy

**BT:** Backtrack Global's mergers according to heuristic rules

- ➊ take **preclustering** defined by **prep strategy**
- ➋ run **Global** to complete

## Dynamic Algorithm

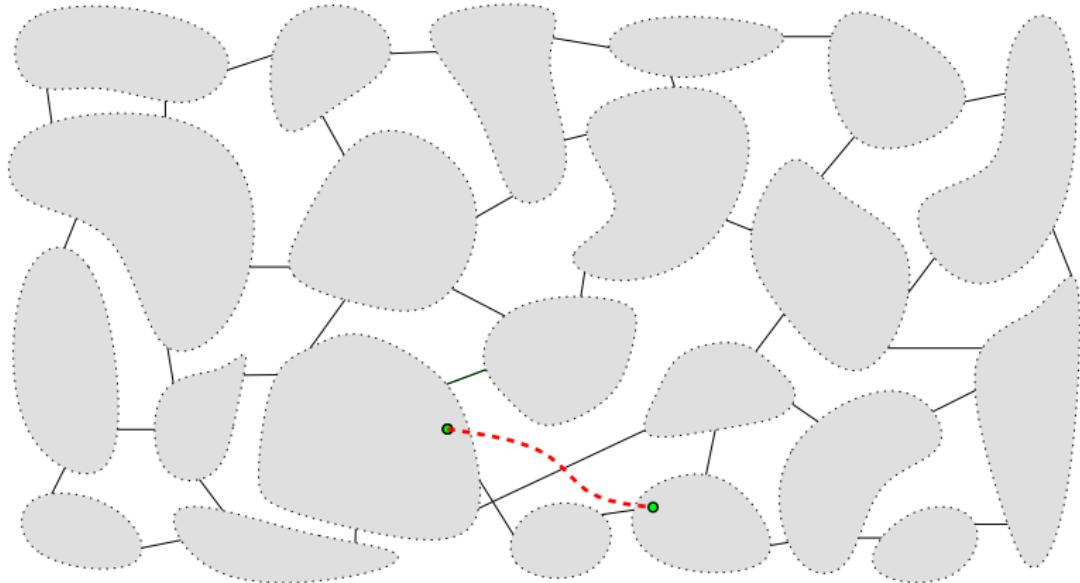

**dGlobal:** Global with  $\tilde{\mathcal{C}}$  as search space

- ➊ take **preclustering** defined by **prep strategy**
- ➋ run **Global** to complete

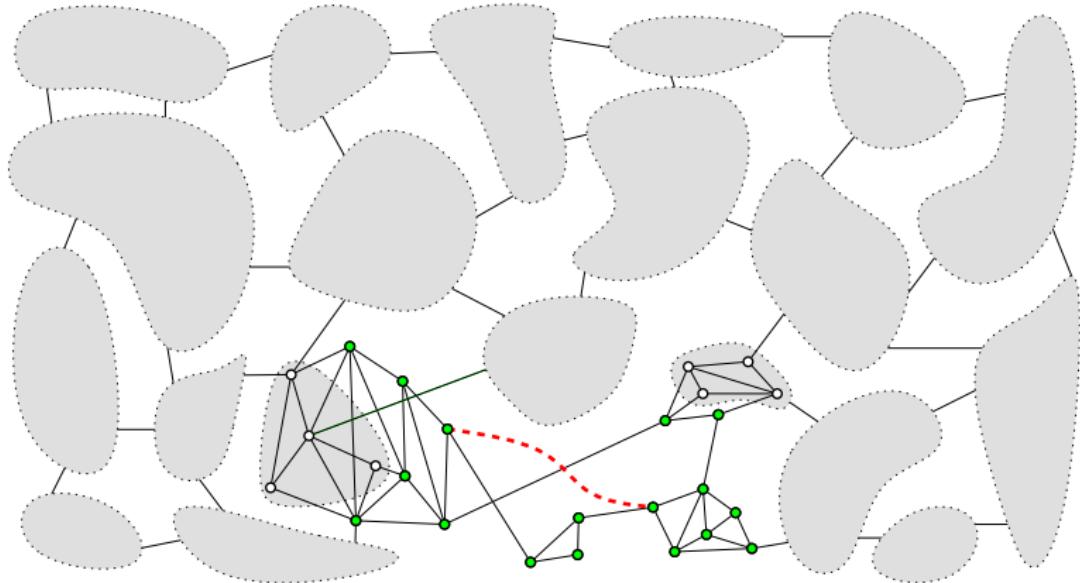

## Dynamic Algorithm

**dGlobal:** Global with  $\tilde{\mathcal{C}}$  as search space

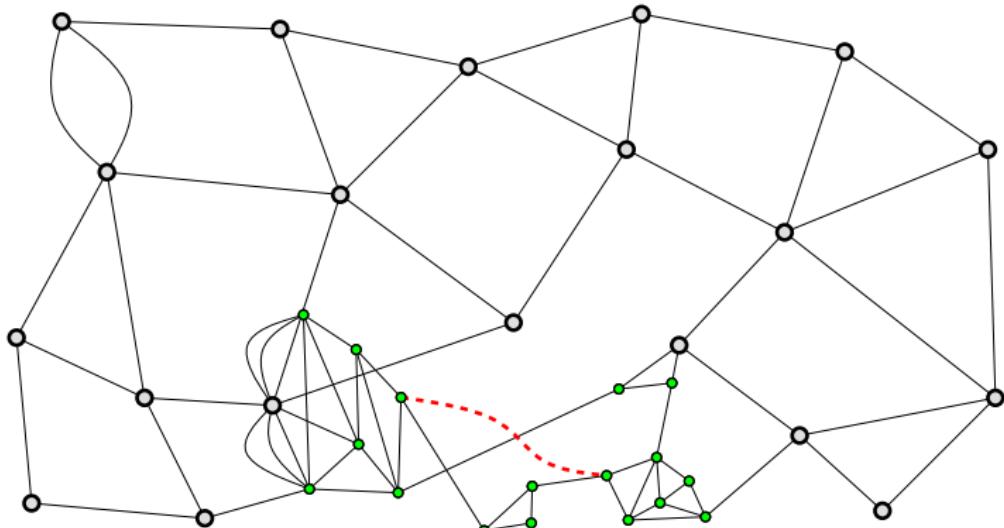

# Illustration: dLocal

# Illustration: dLocal

## Illustration: dLocal

- ① extract some nodes defined by **prep strategy** from **supernodes**
- ② run **Local** to complete

## Dynamic Algorithm

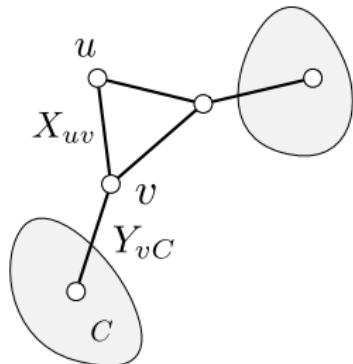

dLocal: Local with  $\tilde{\mathcal{C}}$  as search space

- ① extract some nodes defined by **prep strategy** from **supernodes**
- ② run **Local** to complete

## Dynamic Algorithm

**dLocal:** Local with  $\tilde{\mathcal{C}}$  as search space

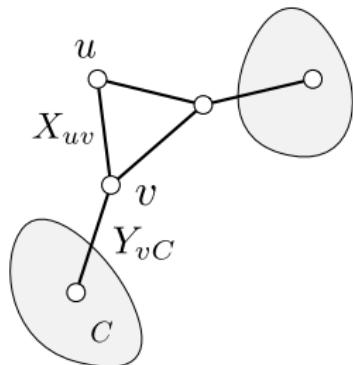

- 1 construct smaller instance of the ILP using the **preclustering**
- 2 solve ILP

## Dynamic Algorithm

dILP: ILP with  $\tilde{\mathcal{C}}$  as search space

- 1 construct smaller instance of the ILP using the **preclustering**
- 2 solve ILP

## Dynamic Algorithm

dILP: ILP with  $\tilde{\mathcal{C}}$  as search space

4 Results

# Dynamic Graph Instances

- generator for dynamic clustered random graphs  
[GÖRKE, STAUDT 2009]
- e-mail graph of KIT CompSci
- arXiv collaboration graph

# Dynamics vs Statics: Speed

**sLocal**  
**sGlobal**

**dGlobal@BN<sub>16</sub>**

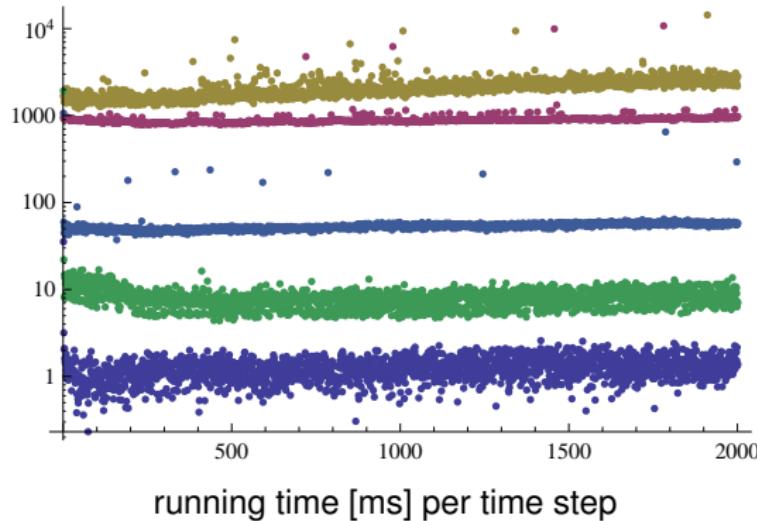

**dLocal@BN<sub>4</sub>**  
**dGlobal@BT**

Small search spaces work best!

## Result

Dynamics run faster

# Dynamics vs Statics: Speed

**sLocal**  
**sGlobal**

**dGlobal@BN<sub>16</sub>**

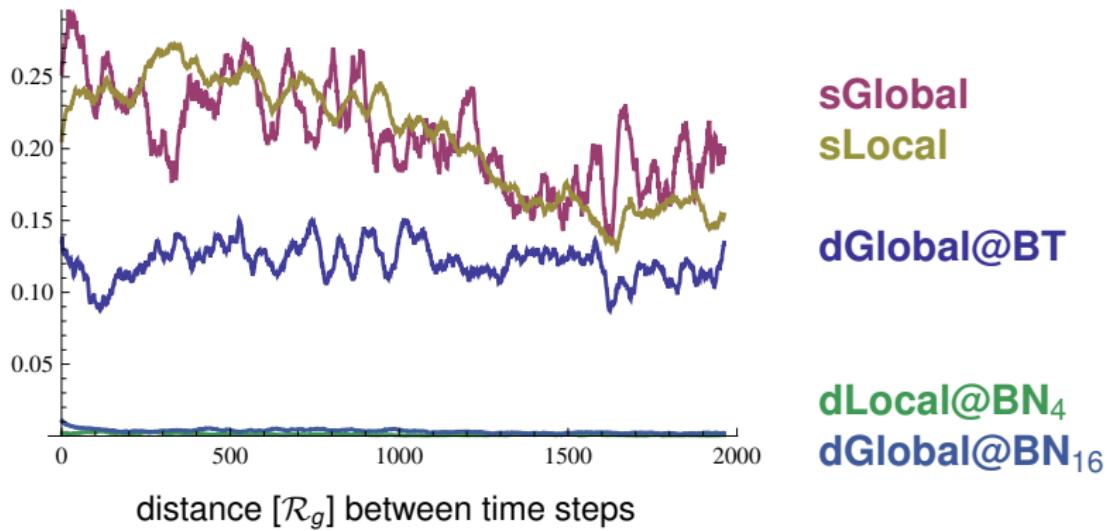

**dLocal@BN<sub>4</sub>**  
**dGlobal@BT**

Small search spaces work best!

## Result

Dynamics run **faster**

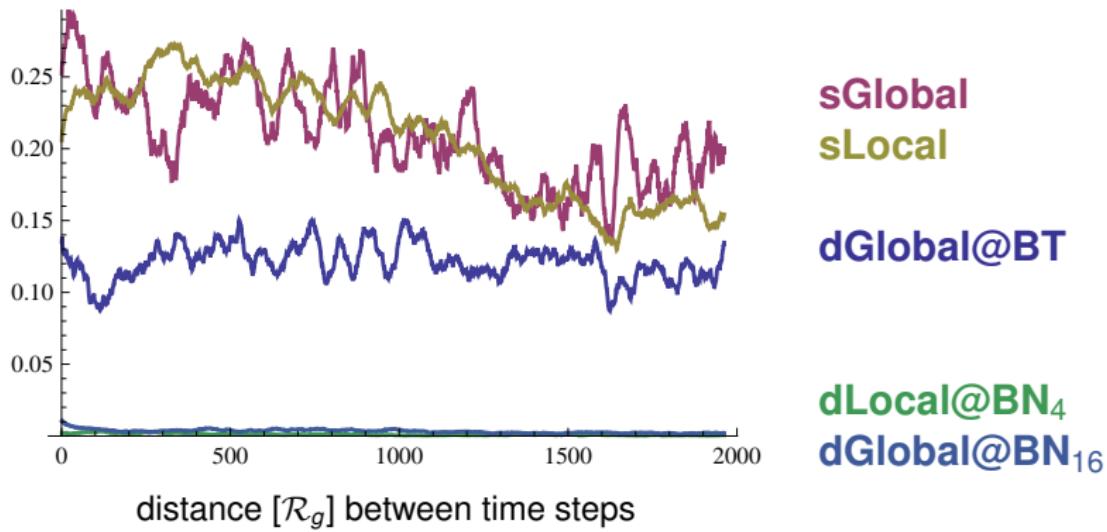

# Dynamics vs Statics: Transitions

## Result

Dynamics yield **smoother clustering transitions**

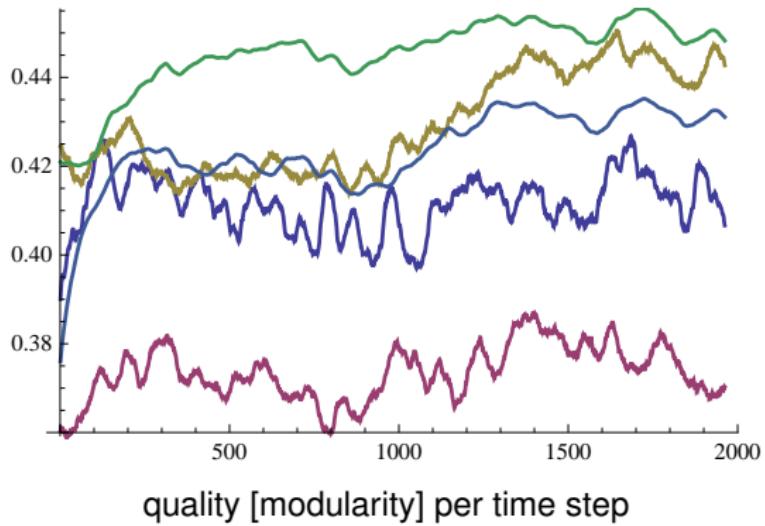

# Dynamics vs Statics: Transitions

## Result

Dynamics yield **smoother clustering transitions**

# Dynamics vs Statics: Quality

dLocal@BN<sub>4</sub>  
sLocal  
dGlobal@BN<sub>16</sub>

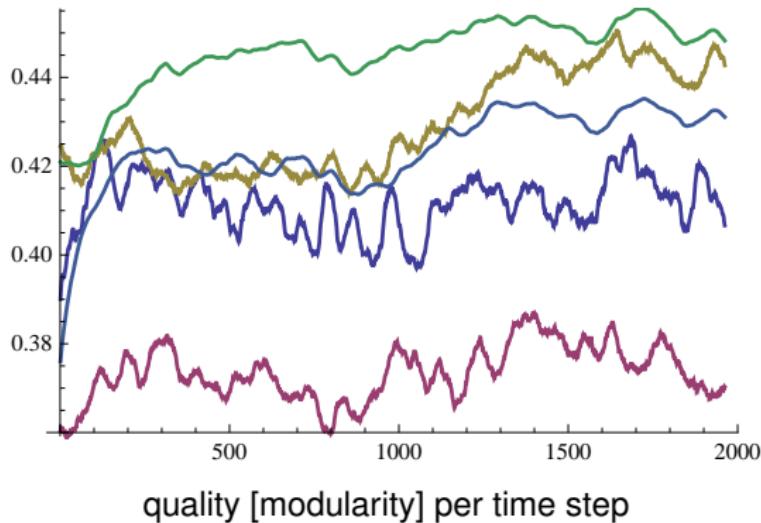

dGlobal@BT

sGlobal

## Result

Dynamics often surpass static counterparts in terms of quality

# Dynamics vs Statics: Quality

**dLocal@BN<sub>4</sub>**  
**sLocal**  
**dGlobal@BN<sub>16</sub>**

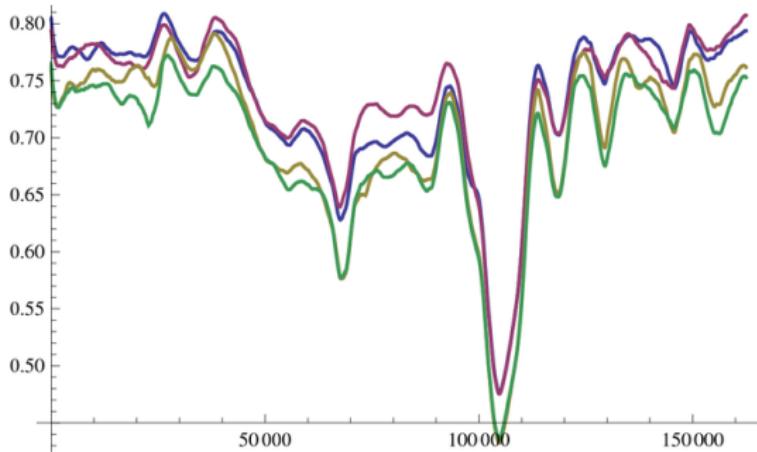

**dGlobal@BT**

**sGlobal**

## Result

Dynamics often **surpass static counterparts** in terms of quality

# Heuristics vs dILP: Quality

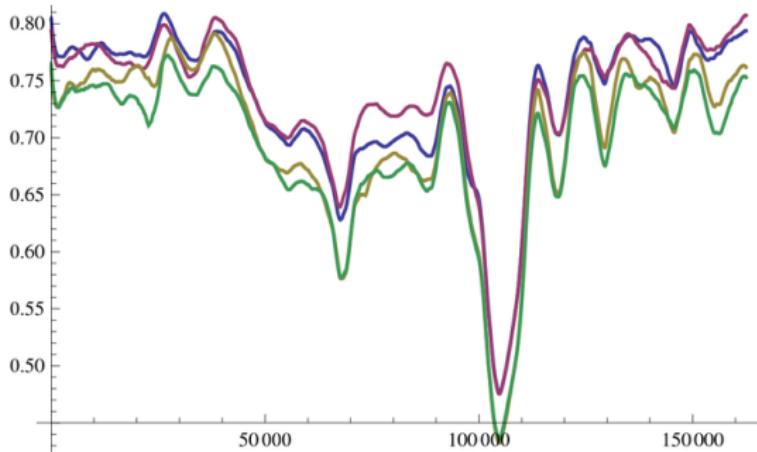

quality [modularity] per time step; e-mail graph

## Result

Local optimality is worse than dynamic heuristics.

# Heuristics vs dILP: Quality

quality [modularity] per time step; e-mail graph

## Result

Local optimality is worse than dynamic heuristics.

# Conclusion

- dynamic versions of state-of-the-art heuristics
- evaluation: dynamics yield better
  - speed
  - quality
  - smooth transitions
- local changes call for local updates
- local optimality does not help
- recommendations for the choice of an algorithm

*Thank you for your attention!*
